"Some Indices of Mineral Metabolism in Workers Exposed to Beryllium Compounds"

Moscow, Gigiyena Truda i Professional'nyye Zabolevaniya, No 5, 1970, pp 52-54

Abstract: The content of magnesium, chlorides, inorganic phosphorus, and calcium was determined in the serum of a group of workers exposed, some sporadically and others regularly, to soluble and insoluble beryllium compounds. None exhibited any symptoms of berylliosis. The calcium, inorganic phosphorus, and chloride levels were found to be within normal limits. But the blood magnesium content was abnormally low, varying with the degree and duration of contact with the toxic agent. These findings are similar to those observed in chronic berylliosis patients, except that the calcium level is abnormally high in berylliosis patients but was normal in the workers.

"Utilization of the Method of Differentiating Antibodies of Different Molecular Weight for Determining the Extent of Antigenic Differences Between Influenza Virus Variants"

Moscow, Voprosy Virusologii, No 5, Sep/Oct 72, pp 529-532

Abstract: White rats were successively immunized with different influenza virus variants at intervals of 1.5-2 months. Blood samples were collected repeatedly and, by means of a sulfhydryl reagent, the antibodies were differentiated into two groups of different molecular weight: 19S and 7S. Immunologically significant differences were observed between influenza A2/Hong Kong/68 virus and the preceding variants of influenza A2 virus. The differences found between A2/57 and A2/65 were less pronounced. It is suggested that the presented method of differentiating related antigens on the basis of immunological memory may be tested on a wider range of antigens.

"The Mechanical Properties and Structure of Aluminum Casting Alloys at Low
Temperatures"

Moscow, Izvestiya Vysshikh Uchebnykh Zavedeniy, Mashinostroyeniye, No 12,
1970, pp 126-130

Abstract: In the article are presented data on change of the mechanical properties, and sensitivity to the concentration of stresses, of aluminum casting alloys of various systems when the test temperature is lowered to 20°K. The character of the interrelationship of the properties and structure of the alloys within the temperature interval of 293-20°K is ascertained, as well as the cause for the embrittlement of a number of alloys at low temperatures. Embrittlement and premature destruction of the alloys at low temperatures are caused by large internal stresses, which bring about the origination and opening of microcracks. 2 tables, 2 figures, 1 bibliographic entry in the form of a footnote.

"Interrelationship of Mechanical Properties and the Structure of Aluminum
and Magnesium Casting Alloys at Low Temperatures"

Kiev, Problemy Prochnosti, No 10, Oct 70, pp 108-112

Abstract: Test results of smooth and notched specimens of aluminum and magnesium alloys in a wide range of low temperatures are presented. The A₁19 aluminum alloy and the VMe2 magnesium alloy showed the best combination of properties in the 293-20°K temperature range. The VA₅ and Me10 alloys showed properties up to a temperature of 77°K. A₁27-1 and A₁8M aluminum-magnesium alloys and the Me5 magnesium alloy can be used safely at temperatures up to 203°K.

ABSTRACT/EXTRACT—(U) GP-0- ABSTRACT. THIS ANALYSIS INCLUDES 132 FAMILIES, IN 94 FAMILIES (200 SUBJECTS) SCOLIOSIS WAS OBSERVED IN 2 AND MORE PERSONS, IN 38 FAMILIES THE RELATIVES OF SCOLIOTIC PATIENTS SUFFERED FROM ENURESIS, 35 SCOLIOTIC PATIENTS ALSO HAD ENURESIS. ALL PATIENTS WITH SCOLIOSIS WERE DIVIDED INTO 3 GROUPS: SCOLIOSIS IN HOMO AND HETEROZYGOUS TWINS, SCOLIOSIS IN PARENTS AND CHILDREN, SCOLIOSIS IN TWO CHILDREN FROM ONE FAMILY. OF 8 PAIRS OF TWINS, 7 PAIRS WERE HOMOZYGOUS. AMONG 8 PAIRS, THERE WERE 6 PAIRS OF SISTERS, BROTHER AND SISTER IN ONE PAIR, AND BROTHERS IN ANOTHER. SCOLIOSIS IN TWINS WAS ALWAYS CONCORDANT, BUT IN ONE OF THEM ALWAYS MORE SEVERE THAN IN THE OTHER. BY THE CHARACTER AND SEVERITY, SCOLIOSIS IN THE DAUGHTER WAS IDENTICAL TO THAT OF THE MOTHER, WHILE IN THE SON IT WAS ALWAYS LESS MARKED. SCOLIOSIS IN THE SON BY THE CHARACTER AND SEVERITY WAS IDENTICAL TO THAT OF THE FATHER, WHILE IN THE DAUGHTER IT WAS ALWAYS MORE SEVERE. SCOLIOSIS OF VARIOUS SEVERITY WAS A RULE IN THE GROUP WHERE IT WAS PRESENT IN TWO CHILDREN OF THE SAME FAMILY. AMONG ALL SCOLIOSIS, THE SCOLIOSSES IN PARENTS AND CHILDREN CONSTITUTED THE LARGEST GROUP AND, MOREOVER, THE INCIDENCE OF SCOLIOSIS IN THE MOTHER AND CHILDREN WAS 3 TIMES HIGHER THAN IN THE FATHER AND CHILDREN. IN ALL GROUPS SCOLIOSIS WAS MORE FREQUENTLY OBSERVED IN THE FEMALES, BUT IN THE GROUP WITH SCOLIOSIS IN THE MOTHER AND CHILDREN, THE PREVALENCE OF FEMALES WAS ESPECIALLY MARKED. THE AUTHORS BELIEVE MYCLODYSPLASTIA AND THE DYSRAPHIC STATUS TO BE THE MOST FREQUENT CAUSE OF SCOLIOSIS DEVELOPMENT.

"The Size of Home Ranges of Rodents in the USSR"

Moscow, Zoologicheskiy Zhurnal, Vol 51, No 1, Jan 72, pp 119-126

Abstract: A survey of the literature is presented in which data are provided on the home ranges of rodents in the USSR. The area of home ranges of various species varies from a dozen square meters to several hectares, in some exceptional cases amounting to 200 hectares. The largest home ranges belong to Sciurus, Spermophilopsis, and Dipus. With a similar feeding pattern among the various species, the home range area corresponds to the size of the animals in question. For animals of similar size, the home ranges of seed consumers are larger than those of vegetation consumers. This consideration holds true, however, only if the mobility of the animals is compared over a brief period. Geographical distinctions in home ranges used by the same species are considerable, and may overlap species distinctions; therefore comparison of the home ranges of different species should be based upon material obtained in the same area.

"Luminescent Determination of Gadolinium, Europium and Samarium as Impurities
in Metallic Uranium"

Moscow, Zhurnal Analiticheskoy Khimii, Vol XX, No 7, pp 1014-1018

Abstract: A quantitative luminescent method of analyzing gadolinium, europium and samarium impurities in metallic uranium is described. A large part of the uranium was separated by a chromatographic method, passing uranyl sulfate in 1 N H_2SO_4 through a column with KUJ-2 cation-exchanger. The rare-earth element impurities remaining in the column were washed out by 4-5 N HCZ. It was established photometrically with the application of arsenazo III that an unacceptable high amount of uranium (~ 0.04 percent from a weighed sample of 10 grams of uranyl sulfate) was washed into the eluate, making necessary the development of additional methods for separation and determination of the rare-earth elements. Luminescent methods were then used. Gadolinium, europium and samarium in metallic uranium were analyzed by the radiation spectra of luminophores based on Y_2O_3 for gadolinium and YVO_4 for europium and samarium. The rare-earth elements were concentrated chromatographically, and the luminescence was spark-excited. This was used to measure the spectra. The sensitivity of analyzing

ANIKINA, L. I., et al., Zhurnal Analiticheskoy Khimii, Vol IX, No 7, pp 1014-1018

gadolinium, europium and samarium was $2 \cdot 10^{-6}$ percent, and the variation factor was 30 percent. The method permits quantitative determination of the indicated rare-earth elements from a weighed sample of up to 1 gram of uranium. As a control, the additive method was used. Gadolinium, europium and samarium were introduced in the amounts of $2 \cdot 10^{-5}$ and $5 \cdot 10^{-5}$ percent after decomposition of the metal uranium by nitric acid. An analysis flow chart and sample luminescence spectra are given in the article.

"Mass Spectra and Structure of Some Pyrrolines"

Leningrad, Zhurnal Organicheskoy Khimii, Vol 7, No 10, Oct 71,
pp 2038-2043

Abstract: The article describes results of a mass spectrometric study of the behavior of compounds of the pyrroline class under the action of electron impact. The following pyrrolines were studied: 2-methyl- Δ^1 -pyrroline, 2-ethyl- Δ^1 -pyrroline, 2-isopropyl- Δ^1 -pyrroline, 2-phenyl- Δ^1 -pyrroline and 1,2-dimethyl- Δ^2 -pyrroline. The mass spectra were obtained at a temperature of 250°, accelerating voltage of 2 kv, cathode emission current of 1.5 and 1.0 ma and ionizing electron energies of 50, 30, 20 and 15 ev. Relative sensitivity coefficients and relative ionization cross-sections were determined. It was found that there is a linear relation between the number of carbon atoms in the alkyl substituent and the relative ionization cross-section, described

1/2

USSR

KLYUYEV, N. A., et al, Zhurnal Organicheskoy Khimii, Vol 7, No 10,
Oct 71, pp 2038-2043

by a regressive equation. It is suggested that in the excited state the studied compounds have an enamine structure and their decomposition path is the result of this form.

"Using GaAs and Nd Lasers for Optical Writing on MnBi Film"

Kratkiye Soobshch. po fiz. (Brief Communications on Physics) No 12, 1972, pp
9-12 (from RZh-Fizika, No 7, 1973, Abstract No 7D1088)

Translation: The possibility of using a GaAs semiconductor laser for recording information on a ferromagnetic film of MnBi is experimentally investigated. MnBi film 700 Å thick, which has undergone condensation in a vacuum on glass substrates of 0.1-0.2 mm in thickness, is used. For recording information, a GaAs laser with a threshold current of 2 amp at 77° K and a p-n junction width of 400 μ m is used. It is shown that the laser's minimum pumping current at which recording is possible is 80 amp, whereas the radiation power is 20 w. The energy density of the radiation on the film is then $6 \cdot 10^{-9}$ j/ μ m². With a monopulse neodymium laser, an evaluation of an information recording density equal to 2500 lines/cm is made. It is noted that the use of a semiconductor laser with a junction width not exceeding 20 μ m permits reducing the power to a fraction of a watt. Bibliography of four.

"A Linguistic Approach to the Problem of Constructing an Information System"

V sb. Inform. vopr. semiotiki, lingvist. i avtomat. perevoda (Information Problems of Semiotics, Linguistics and Automatic Translation), vyp. 2, Moscow, 1971, pp 4-13 (from RZh-Kibernetika, No 4, Apr 72, Abstract No 4V614)

Translation: The paper describes the principles of construction of a "question-answer" information-logic system. It is assumed that a natural language can be used as a base for an information language. The actions of the system are defined by the following relations: 1) text A is an answer to question Q; 2) an answer to question Q may be extracted from text A; 3) every answer extracted from text B is extracted from text A as well; 4) texts A and B give identical answers to any question.

The methods of extracting an answer from the text are not considered in the paper.

Let $z(T)$ designate the number of questions whose answers can be extracted from text T according to the rules of the given system. The sense

"High T-Waves of Noncoronary Origin in Athletes"

Moscow, Sovetskaya Meditsina, No 8, Aug 70, pp 137-139

Abstract: In a study of the EKG's of 53 athletes, a high T-wave ($> 1/2 R$) was observed for 24 (group 1) and a normal T-wave for 29 (group 2). Chest leads were used in taking the EKG's. Group 1 included predominately persons who had performed physical work, trained for endurance, and had high qualifications in the field of athletics, in which they were active. Persons in this group had a lower arterial pressure and a higher Razumov coefficient than athletes in group 2, a fact which indicated superior functional potential of the cardiovascular system. Ballistocardiographic determinations showed better adaptability in the cardiovascular system under conditions of physical loading in group 1 than in group 2. The subjects in group 1 exhibited a higher capacity of the myocardium for contraction, bradycardia, and a moderate sinus arrhythmia. No signs of pathological conditions were noted in the EKG's of either 1/2

NIKITINA, T. N., Sovetskaya Meditsina, No 8, Aug 70, pp 137-139

group. On the basis of the data obtained, a high T-wave is considered to be a characteristic for athletes trained for endurance and to denote a superior functional state of the cardiovascular system in outstanding athletes.

"Mechanism of Modification Conversion in Boron Nitride"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 45, Vyp 12, 1971, pp 3067-3070

Abstract: Cubic boron nitride was synthesized from pyrolytic hexagonal boron nitride and its structure was studied with x-ray diffraction in order to examine the phase conversion mechanism of the hexagonal boron into the cubic form. The synthesis was carried out in a high-pressure chamber loaded with powdered and pyrolytic hexagonal boron nitride. The rate of conversion of powdered hexagonal boron nitride with a three-dimensional lattice was much higher than that of pyrolytic hexagonal boron nitride. It was attributed to a high density of pyrolytic nitride which retarded the flow of the melt between the particles and the solution of hexagonal nitride particles in the melt. The product contained dark and light colored boron nitride crystals with cubic structure. The appearance of the dark-colored crystals was due either to the presence of metal impurities, or to penetration of boron into the crystal lattice of cubic boron nitride. The crystal lattice parameters of the cubic boron nitride varied from $a = 3,6157 \text{ \AA}$ for colorless crystals

1/2

USSR

FEL'DGUN, L. I., et al., Zhurnal Fizicheskoy Khimii, Vol 45, Vyp 12, 1971,
pp 3067-3070

to $a = 3,6181 \text{ \AA}$ for dark-colored crystals. The size of the nitride crystals
was from $\sim 10^{-3}$ to 10^{-2} cm . It is concluded that there was no direct con-
version of the hexagonal boron nitride into a cubic structure, but the latter
was crystallized from the melt due to the presence of unordered B - N com-
plexes in it.

"Electroanesthesia for Treatment of Teeth"

Moscow, Meditsinskaya Tekhnika, No 4, Jul/Aug 72, pp 45-46

Abstract: The portable apparatus ELOZ-1 was designed by the author and B. N. Rostovtsev (All-Union Scientific Research Institute of Surgical Apparatus and Instruments). It is intended to be used in dental offices to produce electro-anesthesia during the treatment of dental caries. The apparatus has a stabilized current supply within ± 5 , and max. resistance of 500 Kohm which can be varied from 100 ohm to 500 Kohm. A metal clip is used as cathode and the dental drill as anode. The clip is attached usually to the patient's ear. The pain is blocked by the electric current in the tooth by affecting the tooth nerve. In order to avoid current bypass, the drill holder is insulated either with epoxy resin or with a teflon sleeve. The current is controlled by a separate unit fixed on the dental chair. The apparatus was tested on 7,320 patients (16,500 tooth cavities were treated) aged 3 to 60. On the basis of clinical data, the optimum current parameters were established for each group of teeth (molars, incisors, etc.). A relationship between the age of patients and electroanesthesia showed that the best results (92%)

1/2

USSR

NIKITINA, T. V., Meditsinskaya Tekhnika, No 4, Jul/Aug 72, pp 45-46

were obtained with children up to 10 years old, followed by 20-40 year-old adults (75%). Such a relationship was not observed for persons older than 50. In order to eliminate the psycho-emotional effects, it is recommended that electroanesthesia be combined with drugs affecting the central nervous system.

ABSTRACT/EXTRACT--(U) GP-6- ABSTRACT. CARDIAC INSUFFICIENCY IS ONE OF THE MOST FREQUENT CAUSES OF MORTALITY AND INVALIDISM IN CARDIOVASCULAR DISEASES. IN THE THERAPY OF CARDIAC INSUFFICIENCY THE MAIN ROLE BELONGS TO CARDIAC GLYCOSIDES. THE PROCEDURE OF THEIR APPLICATION UNDER CLINICAL CONDITIONS HAS BEEN DESCRIBED WELL ENOUGH (G. F. LANG, V. F. ZELENIN, YE. N. TAREYEV, B. YE. BOTCHAL, A. L. MYASNIKOV, A. M. SIGAL, AND OTHERS). THE TREATMENT OF THEM PRESENTS A CERTAIN DIFFICULTY, HOWEVER. IT IS NO ACCIDENT THAT EDENS WROTE THAT DIGITALIS IN THE HANDS OF A THERAPEUTIST IS THE SAME AS A KNIFE IN THE HANDS OF A SURGEON, AND S. P. BUTRIN CONSIDERED EACH APPLICATION OF DIGITALIS A CLINICAL EXPERIMENT. ANALYSIS OF THE HISTORIES OF DISEASE OF PATIENTS WITH CHRONIC CARDIAC INSUFFICIENCY, TREATED IN ONE OF THE HOSPITALS, SHOWED THAT SEVERITY OF THE DISEASE OFTEN IS EXPLAINED BY INADEQUACY OF THE DOSING OF DIGITALIS PREPARATIONS IN THERAPY UNDER HOME AND POLYCLINIC CONDITIONS. V. S. SPILINSKIY, OBSERVING PATIENTS WHO HAD BEEN TREATED IN A CLINIC, NOTED THAT A RARE PATIENT WITH CARDIAC INSUFFICIENCY ENTERS A CLINIC WHO HAS OBTAINED A FULL DOSE OF DIGITALIS AS A RULE IT MUST BE INCREASED 1.5-2 TIMES. OUR REPORT IS DEVOTED TO AN EXPERIMENT IN THE THERAPY OF PATIENTS WITH CARDIAC GLYCOSIDES UNDER HOME CONDITIONS. UNDER OBSERVATION WERE 70 PERSONS WITH INSUFFICIENCY OF THE BLOOD CIRCULATION, 46 MEN AND 24 WOMEN AGED FROM 45 TO 80 (4 WERE 45-50, 9 WERE 51-60, 33 WERE 61-70, AND 24 WERE 71-80 YEARS OF AGE). IN SUFFICIENCY OF THE BLOOD CIRCULATION OF DEGREE IIA WAS DIAGNOSED IN 14, OF IIB IN 36 AND III IN 20 PERSONS.

β -chlorovinyl ketone to give triacetylbenzene.

The interaction of (β -acylvinyl)ammonium salts with monoalkylated dimethyl phosphonoacetone and diethyl ester of benzylphosphonic acid was studied. High yields of the ketovinylation products were obtained in this case, and no formation of self-condensation product was observed. No ketovinylation product could be obtained in the case of diethyl ester of benzylphosphonic acid.

Reactions of α -chloromethyl propyl and α' -chlorodimethyl ethers with potassium derivatives of phosphonoacetic ester, phosphonoacetone and cyanophosphonomethane were studied. Monoalkylation products were obtained in most cases, as well as dialkylation products in a number of cases. According to IR spectral data the alkylation products of phosphonoacetone are derivatives of its enol form.

"Addition Reactions of Aldehydes to α -Ketophosphonic Acid Esters"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 2, Feb 70, pp 294-298

Abstract: Continuing their study of addition and condensation reactions of organophosphorus compounds with an active methylene group, the authors studied reactions of aceto- and benzoylphosphonic acids with aldehydes. It was found that reactions of chloral with dimethyl and diethyl esters of acetophosphonic acid and diethyl ester of benzoylphosphonic acid in benzene at 80° in the presence of piperidine proceed on the carbonyl groups to give dialkyl esters of α -hydroxy- α -acetoxy- or α -hydroxy- α -benzoylhydroxyethylphosphonic acids. At a higher temperature (110°) in toluene there is a phosphonate-phosphate rearrangement to give phosphates. The reactions of dimethyl and diethyl esters of acetophosphonic acid with benzaldehyde and butyl ester of glyoxylic acid, as well as of diethyl ester of benzoylphosphonic acid with benzaldehyde in toluene in the presence of piperidine give the corresponding phosphates.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. BY CONSTRUCTING "TREES OF RELATIONSHIP OF SYNTACTICAL SUBORDINATIONS" THE AUTHORS STUDIED WRITTEN SPEECH OF NORMALS AND IN PARANOID SCHIZOPHRENICS. IT WAS ESTABLISHED THAT THE LAW OF LANGUAGE PROJECTIVELY, EXPRESSED IN A PREVALENCE OF PROJECTIVE STRUCTURES OVER NON PROJECTIVE ARE NOT IMPAIRED IN PATIENTS. THAT THE PROCESSES OF SUCCESSIVE SYNTHESIS IN SPEECH ACTIVITY IN NORMALS AS WELL AS IN SCHIZOPHRENIC PATIENTS PREVAILS OVER PROCESSES OF FORESTALLING SYNTHESIS. HOWEVER, IN PATIENTS THIS PREVALENCE IS EXPRESSED LESS SIGNIFICANTLY. IN OTHER WORDS, THE SPEECH ACTIVITY PROCEEDS IN SUCH CASES WITH A HEAVIER LOADING OF CANALS OF FORESTALLING SYNTHESIS. THE DISTRIBUTION OF THE LENGTH OF SYNTACTICAL CONNECTIONS IN THE NORMALS COMPARED TO THE SPEECH OF SCHIZOPHRENICS IS NEARER TO THE EXPONENT. THE LENGTH OF SYNTACTICAL CONNECTIONS IN PATIENTS IS SIGNIFICANTLY HIGHER THAN IN NORMALS. THIS IS AN OBJECTIVE INDEX OF A CUMBROUS SYNTACTICAL STRUCTURE AND MAY BE EXPLAINED BY AN INERTIA OF OPERATIVE MEMORY.

(Abstract: "Determining the Structure of Atmospheric Aerosol by the Spectral Transparency Method," by N. I. Nikitinskaya, A. Ya. Perel'man and K. S. Shifrin, Leningrad Forestry Academy; Moscow, Doklady Akademii Nauk SSSR, Vol. 190, No. 2, 1970, pp. 331-333)

Determining Structure of Atmospheric Aerosol

This paper presents the results of inversion of data on the spectral transparency of the aerosol component of a layer of the moist atmosphere obtained under conditions of high transparency. Inversion was by the transparency method proposed by K. S. Shifrin, et al., DAN, 151, 326, 1963. This method makes it possible to determine the size distribution of particles without any assumptions concerning the structure of the investigated disperse system. The experimental work was done near Leningrad during a 50-day period in the summer and autumn of 1951, but the only data analyzed here are for 15 days of exceptionally high transparency during prevalence of Arctic air masses. Studies of the spectral transparency were made using a Feisper thermoelectric actinometer operating jointly with a galvanometer having a response of 10^{-9} A and a set of narrow-band interference light filters. Absorption by ozone and oxygen were taken into account.

19790512

Acc. Nr.: AT0047059

The aerosol optical thickness τ_λ was computed using the Bouguer formula. In contrast to the monotonic increase of τ_λ with a decrease in wavelength λ usually observed in a moist atmosphere, during all 15-days characterized by high transparency there was a distinct maximum of the τ_λ curve varying in the range 0.4-0.65 μ . Possible errors in the transparency method are discussed and the results obtained by this method are compared with those obtained by other authors using different methods (in particular, R. W. Fenn, Beiträge zur Physik der Atmosphäre, 37, 69, 1964). It is shown that the use of the transparency method makes it possible to obtain important information on the distribution of radii of aerosol particles by the use of simple instrumentation. The types of distribution of aerosol particles obtained under different conditions by different methods were extremely close.

ABSTRACT. THE VARIATIONS IN THE CHEM. COMPN. OF THE CHARGE COMPONENTS (AS ALLOWED BY GOVERNMENT STDS.) HAS A MUCH LARGER EFFECT ON VARIATIONS IN WEIGHING OF THE COMPONENTS OF THE CAST IRON MELTED, THAN THE VARIATIONS IN WEIGHING OF THE COMPONENTS WITH ERRORS SMALLER THAN OR EQUAL TO 10-15PERCENT. THE AUTOMATED WEIGHING OF CHARGES TO THE CUPOLA SHOULD NOT BE TOO ELABORATE AND A SIMPLE ARRANGEMENT WITH THE ACCURACY OF 10-15PERCENT IS QUITE SATISFACTORY, PROVIDED A LARGE INTERMEDIARY STORAGE IS PROVIDED IN WHICH THE VARIATIONS IN CHEM. COMPN. ARE EQUALIZED.

"Magnetic Hysteresis of Rare-Earth Metals and Alloys"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 30, No 6, Dec 70, pp 1146-
1150

Abstract: A study was made of the hysteresis loops of rare-earth metals and
alloys which possess a magnetic structure of the ferromagnetic spiral type
(Dy-Er and Ho-Er). Ingots of rare-earth metals with a purity of 99.5% were
made in a vacuum-arc zone furnace with a nonconsumable tungsten electrode
and a water-cooled copper hearth. Melting was done under argon at a pressure
of 300-400 mm Hg in two passes with rotation of the ingots. Samples 2.5 mm
in diameter and 28 mm long were machined from the ingots and vacuum annealed
for 24 hours at a pressure of 10^{-3} mm Hg. The magnetic characteristics were
obtained in a superconducting solenoid (50 kiloersted) at 4.2°K. In this
field the hysteresis properties of gadolinium, terbium, dysprosium, holmium,

BELOV, K. P., et al, Fizika Metallov i Metallovedniye, Vol 30, No 6, Dec 70, pp 1146-1150

and erbium and alloys Dy-Er and Ho-Er were studied. A new type of hysteresis was observed in the alloys manifested by failure of the ferromagnetic spiral in a strong field. It was established that despite a vast magnetic anisotropy, cast samples of rare-earth metals and alloys, even under magnetization in a field of 50 kiloersted at 4.2°K, possess comparatively small values of the coercive force which does not exceed 10^3 oersted.

"Differential (Complex) Hypothermia and Its Experimental and Theoretical Basis"

Minsk, Vesti Akademiyi Nauk BSSR, Seriya biyalagicheskikh Navuk,
No 1, 1970, pp 60-66

Abstract: A broad review of the applications of hypothermia is presented and the various biological functions involved, including EKG, biochemistry, hemodynamics, central and peripheral effects, etc. are discussed. An original construction of a cooling chamber is shown, consisting of two chambers, one for the head, and one for the body, in which the temperatures differ. The effect of two-chamber hypothermia, occurring under different degrees of temperature on various reflexes in dogs, hemodynamics, hormones, minerals, and blood proteins is discussed. Various clinical possibilities are discussed and the use of this apparatus in cardiac surgery is suggested.

"Improvement of Mechanical Properties of Hot-Rolled 10KhSND Steel"

Moscow, Metallurg, No 1, Jan 73, pp 16-17

Abstract: Experimental data are presented on the effects of chemical composition, method of final deoxidation, and temperature at the end of rolling on the level of mechanical properties and the amount of waste of 10KhSND steel in the hot-rolled state. The effects of C, Mn, Si, and Cr and their summary effect on the impact strength and the ultimate strength (yield) of 10KhSND steel deoxidized in the ladle with aluminum (1000 g/ton) and ferrotitanium (500 g/ton) are discussed by reference to diagrams. Best results in improving the mechanical properties and in decreasing the amount of waste were obtained by applying calciosilicate (2000 g/ton) and by reducing the rolling temperature to 900°C at the same time. The use of calciosilicate in the final deoxidation of steel in the open-hearth shop of the Plant imeni Dzerzhinskii decreased the amount of waste by 5-5.5 times. Two figures, one table.

piperidole-4-Esters"

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 7, No 12, Dec 73, pp 3-6

Abstract: Twelve 1-dialkylaminoalkyl-2,5-dimethylpiperidole-4-esters were synthesized from 2,5-dimethylpiperidone by acylation with chloroacetic or beta-bromopronionic anhydride, reaction with dimethylamine or diethylamine, reduction with lithium aluminum hydride, and acylation with acetic, benzoic or 3,4,5-trimethoxybenzoic acid. Water soluble salts were formed with D-tartaric acid for convenience in pharmacological studies. The stereochemistry of the starting material and one of the simplest intermediates was checked by proton magnetic resonance. The compounds showed no analgesic effect on mice or rats. Small doses in narcotized cats gave a small, short-term hypotensive effect, while larger doses were toxic. No cholinolytic action was found in isolated rabbit ears or intestinal sections.

"Synthesis and Pharmacological Study of Substituted 2,2,6,6-Tetramethyl-4-
-aminopiperidyl-4-carboxamides"

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 7m No 9, Sep 73, pp 16-19

Abstract: Derivatives of 2,2,6,6-tetramethyl-4-aminopiperidyl-4-carboxamide (I) -- analogues of the pyrithramide --- were synthesized in search for new analgesic agents. The reaction sequence was based on triacetoneamine being converted through the triacetoneaminocyanhydrine to 2,2,6,6-tetramethyl-4-(N-substituted)amino-4-cyanopiperidines which could be converted with 90% sulfuric acid at 100° to (I). Further alkylation of these carboxamides was very difficult. Pharmacological studies carried out on these products showed that steric hindrance around the cyclic nitrogen atom with methyl groups did not improve the analgesic or other pharmacological properties of the parent agents.

"Synthesis of N'-Substituted 4-Aminopiperidines With a Shielded Nitrogen Atom"
Riga, Khimiya Geterotsiklicheskih Soyedineniy, No 12, Dec 71, pp 1672-1678

Abstract: A detailed study was carried out of the triacetoneamine cyanohydrine (I) reaction with ammonia and various amines. It has been shown that (I) reacts with fatty and aromatic amines in methanol at 0-20°C yielding respective 2,2,6,6-tetramethyl-4-cyano-4-amino piperidines (II). Aromatic amines do not react under these conditions. The α -aminonitriles (II) are thermally unstable, and when heated above 50°, they split HCN, forming tetramethylpiperidines. Decyanation of (II) occurs also easily when these compounds are reduced with LiAlH₄, yielding pure N'-substituted-2,2,6,6-tetramethyl-4-aminopiperidines (III). Reacted with formic acid and formalin, (III) are easily methylated at the piperidine nitrogen atom. In cases where the exocyclic nitrogen atom happens to be a secondary amine, it also becomes methylated. The products -- N',N-disubstituted 1,2,2,6,6-pentamethyl-4-aminopiperidines are strong bases; they give stable dihydrochlorides.

"Synthesis and Conversions of 6,6,7,7-Tetramethylquinuclidone-2"

Riga, Khimiya Geterotsiklichesikh Soyedineniy, Academy of Sciences Latvian
SSR, No 3, 1971, pp 378-384

Abstract: A new representative of the quinuclidone-2 series -- 6,6,7,7-tetramethylquinuclidone-2 (I) -- was synthesized from (2,2,6,6-tetramethyl-piperidyl-4)acetic acid (II) by converting the latter to its acid chloride and then treating it with triethylamine. I has the following properties: λ_{max} 230 microns (in alcohol), pK_a 6.37 ± 0.05 (in water, determined potentiometrically), and dipole moment 3.95 D (in benzene). I participates in three types of chemical reactions: 1) in reaction with protonic nucleophilic agents (water, alcohols, amines, hydroxylamine, and hydrazines), the N-CO bond is ruptured and the nucleophilic agents are alkylated. I reacts more readily with nucleophilic reagents than do other amides, ranking between ketones and acid halides. 2) Unusual conversions are observed when the amide of I is treated with nucleophilic agents in aprotic media (phenyllithium in ether, phosphorus

1/2

pentachloride in benzene, acetone cyanohydrin, and lithium aluminum hydride in ether). The N-C (CH_3)₂ bond is ruptured with the formation of 4-substituted 6,6-dimethylpiperidones-2. 3) When I is treated with electrophilic reagents (hydrogen chloride and methyl iodide) in aprotic solvents, reactions occur with the retention of the quinuclidine ring. This is also true in the reduction reaction of I.

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 6, No 2, Feb 70, pp 13-16

Abstract: Sixteen phenothiazine derivatives of 3,9-diazabicyclo(3,3,1)-nonane were prepared, based on 3,-benzyl-3,9-diazabicyclo(3,3,1)nonane. In experiments with rats it was found that neurological properties decrease when the dimethyl amine group in the amineazine molecule is replaced by 3-methyl-3,9-diazabicyclo (3,3,1)-nonane. Shortening or lengthening the propyl chain in the cyclic system also leads to a decrease in neurological activity.

"Experimental Investigation of a Turbulent Boundary Layer in the Case of Intensive Blow-in"

Tr. Mosk. vyssh. tekhn. uch-shcha im. N. E. Baumana (Works of the Moscow Higher Technical Academy imeni N. E. Bauman), 1971, No. 144, pp 80-87 (from RZh-Mekhanika, No 5, May 72, Abstract No 5B970)

Translation: The article deals with analysis of the results of an experimental study of an isothermal boundary layer on a porous plate measuring 450×50 mm when air is blown into air. The blow-in intensity $(\rho V)_\infty / (\rho U)_\infty$ varied over limits from 0.0008 to 0.022. The velocity of the main flow was $\sim 40 \text{ m} \cdot \text{s}^{-1}$. There was a slight negative pressure gradient. Included in front of the porous plate was a section $l = 62$ mm without injection, and the boundary layer was suctioned off in front of this section to eliminate the influence of the initial conditions. In the experiments, the thickness distribution of the boundary layer of dynamic and static pressures was measured in 12 sections lengthwise of the plate. The flowrate of the air blown in through the porous plate was determined. The pressure field was taken

by pneumometric probes with aperture size of 0.1 mm. Measurement accuracy was $\pm 2\%$. The velocity field in the boundary layer over the plate was determined on the basis of the measurements. The integral characteristics of the boundary layer were calculated: the displacement thickness δ^* , the impulse loss thickness δ^{**} , the formfactor $H = \delta^*/\delta^{**}$, the coefficient of friction on the plate C_{fw} .

"The Role of Animals and Birds as Sources of Salmonella Infections in Man"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, Vol 10, Oct 70,
pp 123-130

Abstract: A review is presented of the literature concerning the etiology of human salmonellosis in various countries, including the Soviet Union, Britain, Sweden, Holland, Spain, the United States, Canada, Mexico, Argentina, Uruguay, Japan, Indonesia, Ceylon, the United Arab Republic, and Australia. There is a universal consensus that animals and birds constitute the principal source of Salmonella infections in man. Data are cited from numerous authors which indicate that the frequency of salmonelloses among animals and birds varies not only from country to country but also from region to region within a single country. Of all the animals investigated, cattle and hogs are the main transmitters of salmonelloses; goats and horses are of lesser epidemiological significance. Poultry, particularly ducks and geese, display a high incidence of Salmonella (mainly S. typhimurium) infections and also play a very important role in the epidemiology of salmonelloses.

"Integrated Circuit Analog-Digital Converter"

Moscow, Pribory i tekhnika eksperimenta, No 1, Jan-Feb 71, pp 102-105

Abstract: This paper describes an analog-digital converter built as an integrated circuit, defining it as a device for measuring pulses and slowly varying voltage levels with an accuracy of at least 99.9 to 99.8%. The measured voltage is in the form of a series of pulses in a sequence code and a parallel 10-bit code at the counter output. The counter indication is given in light on the unit's front panel. There is also a special oscillator with a pulse repetition frequency of 40-50 Hz to check the instrument's accuracy. For measurement of slowly varying or constant voltage levels, linear gates opened by externally supplied pulses or from a front-panel knob are supplied. Specifications are given, and diagrams of the converter and one of its linear gates are shown. Diagrams of the pulse oscillator and counter are also reproduced. There are also two tables, one for

PHAGE TYPING OF S. TYPHIMURIUM ISOLATED IN VARIOUS
TERRITORIES OF THE USSR

N. M. Nikityuk

A method of phage typing was applied to the study of 1,308 strains of S. typhimurium, isolated from human beings (sick and carriers), animals and from food stuffs. The cultures were isolated in various territories of the USSR. Strains of 14 phagotypes and their variants were revealed in man, and of 10 phagotypes — in animals. The most frequently encountered in man and animals was strains of 2b phagotype. There were noted some peculiarities in the distribution of S. typhimurium phagotypes at various USSR territories. Phage typing of S. typhimurium served as a valuable method for improving the quality of epidemiological examination and analysis of diseases caused by this causative agent.

"A Nonresonator Parametric Light Emitter Based on a Crystal of α -HIO₃"

Pis'ma v ZhETF (Letters to the Journal of Experimental and Theoretical Physics), 1971, 13, No 8, pp 440-443 (from RZh-Radiotekhnika, No 7, Jul 71, Abstract No 7D349)

Translation: The paper describes a cavityless parametric light generator with continuous frequency tuning in a range of 1-1.1 μ , and with an energy conversion factor of 57 percent. Experimental realization of such a generator requires the use of highly effective nonlinear crystals. A crystal of α -HIO₃ is used. The width of the spectrum of the output emission was 0.2 cm⁻¹. The directivity of the emission is approximately 4 min. The cavityless parametric light generator circuit can readily be converted to a parametric light generator with a resonator for one frequency. "Surface Wave Stimulation by an Ultrasonic Beam on the Liquid-Solid Medium
Interface"

Sverdlovsk, Defektoskopiya, No 3, 1973, pp 45-53

Abstract: This article was devoted to solution of the two-dimensional problem on surface wave stimulation with an ultrasonic beam in the case of a liquid wedge (immersion variant, local bath, overflow detector, etc.). Formulation of the problem in two dimensions does not make it possible to consider the diffraction separation of the stimulated wave but it does yield the possibility to concentrate attention on the characteristics features of the beam conversion process in the surface wave. 2 figures, 3 bibliographic references.

"Puffs Induced by Thiocyanate and the Puff Model For Determining Drug Injury
to Enzymes"

Moscow, Doklady Akademii Nauk SSSR, Vol 196, No 5, 1971, pp 1,217-1,220

Abstract: The modification of Drosophila chromosome puffs induced by sodium thiocyanate added to the nutrient medium in a concentration of $2 \times 10^{-4} M$ was investigated. As a result of corporation of this compound, the number of puffs increased from 26 (control) to 28 in X-chromosomes; from 17 to 24 in 2L-chromosomes; from 21 to 23 in 2R-chromosomes; from 24 to 28 in 3L-chromosomes; and from 22 to 28 in 3R-chromosomes. Significant changes were also observed in the morphology of other puffs and in the activity of chromosome enzymes. This method appears to be very useful in the study of the biological effects of drugs on pathogens and on the host.

"Diffuse Reflection of Resonance Radiation From a Semi-Infinite Medium"

Yerevan, Doklady Akademii Nauk Armyanskoy SSR, LIV, No 2, 1972, pp 91-95

Abstract: Because of its complexity, the problem of radiation transfer in spectral line frequencies has usually been attacked with the simplifying assumption of total frequency redistribution; but this assumption contradicts both the dependence of redistribution on scattering angle, and the presence of correlation between frequencies of absorbed and reradiated quanta.

A mathematical basis for future development of an effective solution of the problem of diffuse light reflection from a homogeneous semi-infinite medium is worked out, using V. A. Ambartsumyan's invariance principle. Due allowance is made for noncongruence and anisotropy of an elementary act of scattering. The study is an extension of the authors' earlier work, in which a strict examination of noncongruent scattering was undertaken, along with consideration of the redistribution-scattering angle relationship.

"A Method of Making 2-Chloroethyl-2-thiocyanatoethylamine"

USSR Author's Certificate No 345142, filed 27 May 70, published 15 Aug 72 (from RZh-Khimiya, No 10, May 73, abstract No 10N560P by T. Ya. Ogibina)

Translation: A method is proposed for synthesizing 2-chloroethyl-2-thiocyanatoethylamine (I). The compound is used as a biologically active material in agriculture because of the presence of the β -chloroethyl and β' -thiocyanethyl groups in the molecule. Example: 0.1 mole of N-(2-chloroethyl)-ethylenimine in 100 ml of C_6H_6 is added over a 30 minute period to 20 ml of dry ethyl solution containing 0.3 mole of HSCN with cooling by ice water, the mixture is agitated for one hour at about $20^{\circ}C$, and the product is isolated from the organic solution and washed in absolute ether yielding 19.7 g of thiocyanide of compound I, $C_6H_{10}ClN_3S$, melting point $78-9^{\circ}C$ (Acetone).

"Analysor Function in Persons Exposed to Radio Waves"

Moscow, Gigiiena Truda i Professional'nyye Zabolevaniya, No 7, 1971, pp
49-51

Translation: Many experimental and clinical studies have been published which show that the central nervous system is highly sensitive to radio waves (Z. V. Gordon et al.; Z. V. Gordon, 1966; Ye. A. Lobanova and Z. V. Gordon; E. A. Drogichina and M. N. Sadchikova; Z. M. Gvozdikova et al.; D. A. Ginzburg and M. N. Sanchikova; P. P. Fukalova; Yu. A. Kholodov; I. A. Kitsovskaya, 1968). In the light of these findings and of the generally held opinion that various neurological disorders may be reflected in the state of analysor excitability, we investigated vestibular and visual analysor functions in persons exposed to radio waves of different bands.

We examined 170 engineers, technicians, operators, and specialists in thermal treatment of metals handling high-frequency, ultrahigh-frequency, and microwave oscillators. They included 138 males and 32 females mostly
1/6

NIKOGOSYAN, S. V., Gigiyena Truda i Professional'nyye Zabolevaniya, No 7, 1971, pp. 49-51

between 20 and 40 years of age (148 persons) with experience ranging from several months to 10 years or more (up to 1 year -- 28, from 1 to 5 years -- 71, from 5 to 10 years -- 30, over 10 years -- 41).

The control consisted of 50 persons who had not been exposed to radio waves (laboratory workers in the administrative division and trainees 20 to 40 years of age). Visual and vestibular functions were studied using a pulsed electronic stimulator (ISE-01). Dark adaptation was also determined (adaptometer, ADM model).

Definite deviations were noted in the functional state of these analysors. Changes in the sensitivity of the visual and vestibular analysors were manifested by an elevation of the threshold of excitability, as shown by rheobase and chronaxy. Changes in the sensitivity of the visual analyser were further characterized by a lengthening of the time required for dark adaptation.

The number of cases and intensity of the changes in sensitivity of the vestibular and visual analysors tended to increase with length of time

2/6

USSR

NIKOGOSYAN, S. V., Gigiyena Truda i Professional'nyye Zabolevaniya, No 7, 1971, pp 49-51

on the job. It is evident from the foregoing that the high-frequency, ultrahigh-frequency, and microwave ranges lowered the excitability of the visual and vestibular analysors and impaired the time of dark adaptation, obviously a sign of functional changes arising in the central nervous system as a result of exposure to radio waves.

The results of our studies are in agreement with data indicating that the threshold of olfactory sensitivity rises in persons exposed to microwaves (Ye. A. Lobanova and Z. V. Gordon), ultrahigh-frequency and high-frequency waves (P. P. Fukalova and Ye. I. Smurova; P. P. Fukalova). Similar changes in dark adaptation were observed by P. P. Fukalova in persons exposed to short waves and ultra-short waves.

Experimental studies have shown that the microwave range is the more active biologically (Z. V. Gordon, 1964; I. A. Kitsovskaya, 1968).

We observed more pronounced deviations in the state of the visual and vestibular analysors in the ultra-high frequency and high-frequency

3/6

USSR

NIKOGOSYAN, S. V., Gigiyena Truda i Professional'nyye Zabolevaniya, No 7, 1971, pp 49-51

ranges, which we ascribed to the working conditions of the examinees. As sanitary-hygienic investigations have demonstrated, the intensity of ir-radiation produced by ultrahigh-frequency and high-frequency oscillators exceeded the maximum permissible doses several dozen times, which was not the case when microwave oscillators were in operation. Moreover, such accompanying factors as noise and the strain of working on shifts (at radio stations) acting on the central nervous system may also play a role in the origin of changes in analysor function.

A comparison of the results of the examination of the health status of persons exposed to radio waves and studies of analysor sensitivity revealed a correlation between the clinical manifestations of the effects of micro-waves, ultra-high frequency and high-frequency waves and changes in analysor excitability.

However, changes in analysor sensitivity were also detected in persons with no clinical symptoms of exposure to radio waves. Hence changes in analysor

excitability may arise in the preclinical stage.
